BLACKFRIARS BRIDGE FORESHORE WORKS UPDATE – AUTUMN 2024

Works towards completion of the new super sewer at Tideway's Blackfriars Bridge Foreshore site are progressing well. The piles for the cofferdam (the temporary area of land built into the river to allow construction to take place) have all been removed now. We have also completed the precast cladding of the new river wall.

The new Blackfriars public realm is beginning to take shape. At 110 metres long it is the largest single structure built into the River Thames in some 150 years.

Our temporary offices that were situated at street level have been dismantled and the team are now based at the lower level on the old walkway.

Sections of the new Tideway Tunnel are currently being tested ahead of its proposed full operational opening in 2025.
